ABSTRACT

SANTI DWI RATNAPURI. Gender Analysis in Agroforestry Management (Case Study of PLN Pangalengan Area, Bandung). Supervised by DIDIK SUHARJITO.

The objectives of this research were to describe and explain the role division of women and men in agroforestry management activities, and to explain the effect of socio-economic factors. This research was carried out agroforestri project area managed by PLN in Pangalengan Sub-district, Bandung District, West Java Province during in March 2011. The respondent amounted 30 households.

Research result show that women has lower role than men in agroforestry management. It was proved by the lower of time spent by women in productive activities, which amounted 41.9%, while men, achieve 80%. But then it was inversely with research result on time spent in reproductive activity, where women was more dominate than men. Decision making in agroforestry management activities were dominated by men, while financial and common interest sector was decided together by husband and wife. In reproductive sector, such as food menu determination, the decision was most relied to women. By the good cooperation and role division between husband and wife, it was proved that gender equality in PLN area of Pangalengan Sub-district has been well interlaced.
