Urban development has played a big role in the growth of human needs. It is a well-known fact that urbanization tends to maximize the structure, minimize the open space, and eliminate the nature. These normally develop in the absence of adequate foresight, control, and organization. Such condition would implicate human living and human needs of natural landscape such as an open area of greenery. A qualified green open space can be created only by making use of a good design and utilizing the right process. This open green area concept would be a definite need especially in a residential area such as Jakarta Garden City (JGC). JGC, as one of the big residential complex in Jakarta, consists of not only houses but also other public facilities such as food market, shopping arcade, hospital, school, golf country club, office area, hotel, and community park. The objective of the project is to create a design of a community park in the middle of urban area that integrates well with the surrounding, especially with the residential area. This community park would serve as a response of open space degradation. Through this internship, the student would have the opportunity to enhance his/her practical knowledge and experience, as well as to improve his/her design process ability and skills in order to create an attitude of professionalism in landscape architecture field. In a more specific details, this internship is also intended to analyze JGC community park design process; to analyze the work culture/management at Oemardi_Zain Landscape Consultancy; and to identify the endorsers and inhibitors of JGC community park design process. By doing internship at Oemardi_Zain Landscape Consultancy, a consultant with good portfolios and years of experiences, the student would be able to learn much about landscape design process, especially by working on a project design in Jakarta Garden City community park. The internship involves active participation, interview with employees, direct observations on site, and literature study. In this case, the student has completed a landscape design process in designing a qualified open space to fulfill human needs in natural landscape.
