Proceedings of

2015 3rd International Conference on
Adaptive and Intelligent Agroindustry (ICAIA)

IPB International Convention Center, Bogor, Indonesia
August 3rd – 4th, 2015

Published by:

Department of Agroindustrial Technology
Bogor Agricultural University
Bogor, Indonesia
Welcome Message from The General Chairs of ICAIA 2015

On behalf of the organizing committee, it is our pleasure to welcome you to International Conference on Adaptive and Intelligent Agroindustry, Bogor, Indonesia. This is the 3rd conference on the topic that is held by the Department of Agroindustrial Technology, Bogor Agricultural University, Indonesia.

The conference is expected to provide excellent opportunity to meet experts, to exchange information, and to strengthen the collaboration among researchers, engineers, and scholars from academia, government, and industry. In addition, the conference committee invited five renowned keynote speakers, i.e. Prof Irawadi from Bogor Agricultural University; Prof Kenneth De Jong from George Mason University, USA; Dr Yandra Arkeman from Bogor Agricultural University; and Dr Guillermo Baigorria from University of Nebraska-Lincoln, USA.

The conference committee also invited Prof Noel Lindsay from University of Adelaide, Australia; Kiyotada Hayashi from National Agricultural Research Center-Tsukuba, Japan; Prof Margareth Gfrerer from Islamic State University of Jakarta, Indonesia; Dr Barry Elsey from University of Adelaide, Australia; Dr Gajendran Kandasamy from Melbourne University, Australia; and Imperial College London-British, Prof Allan O'Connor from University of Adelaide, Australia; Dr Wisnu Ananta Kusuma from Bogor Agricultural University, Indonesia; and Dr Frank Neumann from University of Adelaide, Australia, as invited speakers.

This conference was organized by Department of Agroindustrial Technology, Bogor Agricultural University and Asosiasi Agroindustri Indonesia, and technically sponsored by IEEE Indonesia Section. Furthermore, it was supported by Departement of Computer Science, Bogor Agricultural University; Surfactant and Bioenergy Research Center; PT Bogor Life Science and Technology; Indonesian Ministry of Industry; PT Pachira Distriusna; and PT Kelola Mina Laut.

I would like to take this opportunity to express my deep appreciation to the conference’s committee members for their hard work and contribution throughout this conference. I would like to thank authors, reviewers, speakers, and session chairs for their support to participate in the Conference. Lastly, I would like to welcome you to join ICAIA 2015 and wish you all an enjoyable stay in Bogor.

Sincerely,
Dr Yandra Arkeman
General Chairs, ICAIA 2015
Assalamu’alaikum Warohmatullahi Wabarokatuh
In the name of Allah, the beneficent and the merciful,

Distinguish Guest, Ladies and Gentlemen
Let me first thank you all for accepting the invitation to participate in this 3rd International Conference on Adaptive and Intelligence Agroindustry (ICAIA). In particular I would like to thank Rector of IPB (Institut Pertanian Bogor/Bogor Agricultural University) Prof. Herry Suhardiyan for supporting this event as part of the series academic event in celebrating the 52nd Anniversary of Bogor Agricultural University.

We are certainly proud to have been able to assemble this event in IPB, Bogor. The range of participants and audience at this conference is precisely something I would like to stress. Participants who followed the event more than 150 people, coming from various countries including the USA, Australia, Japan, Vietnam, Philippine, Germany and Indonesia. The main goal of the conference is to provide an effective forum for distinguished speakers, academicians, professional and practitioners coming from universities, research institutions, government agencies and industries to share or exchange their ideas, experience and recent progress in Adaptive and Intelligent Agroindustry.

The 2015 3rd International Conference on Adaptive and Intelligent Agro-industry (ICAIA) is the third forum for the presentation of new advances and research results on various topics in all aspects of innovative agro-industry that highlights the development and improvement for today and tomorrow’s global need for food, energy, water and medicine. The aim of the conference is to stimulate interaction and cohesiveness among researchers in the vast areas of innovative agro-industry. Innovative Agro-industry has the ability to adapt intelligently to future global challenges, i.e. food, energy, water, and medical. Global challenges needs a new breed of Agroindustry which could produce innovative products to fulfill the needs through advanced processing technology, production systems and business strategy supported by cutting-edge information and communication technology.

The topic for this event is “Empowering Innovative Agroindustry for Natural Resources, Bioenergy and Food Sovereignty”. The topics clustered into four main parts:
Track 1 : Innovative Agroindustrial and Business System Engineering
Track 2 : Frontier Approaches in Process and Bioprocess Engineering
Track 3 : Frontier Approaches in Industrial Environmental Engineering
Track 4 : Intelligent Information and Communication Technology for Adaptive Agroindustry of the Future

This event also hosts four (4) workshops: (1) Strategies for Agroindustry Development (2) LCA for Agroindustry (3) Innovation and Technopreneurship for Agroindustry and (4) Agroindustry Informatics.

Distinguish Guest, Ladies and Gentlemen,
Agroindustry transforms agricultural commodities into high value-added products. Agroindustry is industry that process agricultural products to increase their value added significantly by using technology and by considering environmental aspect and sustainability. However, with changing global demand and technology advancement, innovative agroindustry is needed in order to be competitive as well as sustainable. The challenge of future agroindustry is not merely efficiency and productivity anymore, but also the challenge to appropriately apply frontier technology as well as meeting future global demands.

Agroindustry needs to deal with the application of advance technologies and cope future global issues. Current global issues which arise and expected to exist in the future are food sovereignty, renewable energy, sustainable water management and pharmacy. The ability of agro-industry to respond the future global issues and the undoubtedly substantial increase in demand in future decades will be highly dependent on the increased application of existing technologies as well as the exploitation of new and innovative technologies.

The emergence of high technology could be applied in the agro-industry are: nanotechnology, biotechnology, bioinformatics, food processing, food packaging-waste, state-of-the-art computation and many others. The aforementioned high-technology along with computation technology could greatly advance agro-industry from a traditional system into a smart-intelligent and innovative technology. Therefore, in the new millennia, adaptive-intelligent and innovative agro-industry will contribute to solutions to global problems and brings agriculture into perfection.

Hope this conference will also discuss this issue in more detail as it is an important matter for all of us. We should no more think just how to produce high value product but it is also necessarily important how to keep our live in good quality by understanding following old saying… “You do not live at once. You only die once and live every day”.

I do not to take up any more of your time with these opening remarks. Let me simply thank you once again for sharing your thoughts with us. Here’s wishing every success for the conference. May Allah bless all of us.

Thank you for your kind attention,
Wassalamu’alaikum Warohmatullahi Wabarokatuh
### COMMITTEE

**Condescendent**  
Prof. Dr. Ir. Herry Suhardiyanto, M.Sc (IPB’s Rector)

**Steering Committee**  
**Chairman**  
Prof. Dr. Ir. Nastiti Siswi Indrasti  
**Vice**  
Dr. Ir. Yandra Arkeman, M.Eng

**Board member**  
Prof. Dr. Ir. Aziz Darwis  
Prof. Dr. Ir. Irawadi Djamaran  
Prof. Dr. Ir. Eriyatno, MSAE  
Prof. Dr. Ir. Anas M. Fauzi  
Prof. Dr. Ir. Syamsul Maarif, M.Eng  
Prof. Dr. Ir. Machfud, MS  
Prof. Dr. Ir. Djumali Mangunwidjaja

**Organizing Committee**  
**Chairman**  
Dr. Ir. Yandra Arkeman, M.Eng

Abstract of Invited Speakers
Noel Lindsay 1
Kiyotada Hayashi 2
Barry Elsey 3
Frank Neumann 4
Yandra Arkeman 5
Wisnu Ananta Kusuma 6

Innovative Agroindustrial and Business System Engineering
The Feasibility Study of Establishment of Biodiesel And Paving Block Industry From Spent Bleaching Earth
Febriani Purba, Ani Suryani and Sukardi 7
Green Supply Chain Management Innovation Diffusion in Crumb Rubber Factories: Designing Strategies towards Implementation
Tri Susanto, Marimin Marimin and Suprihatin 13
Mobile Business Analytics System for Service Level Analysis of Customer Relationship Decision
Taufik Djatna and Yudhistira Chandra Bayu 19
Exploring an Innovative Approach to Address Non-Tariff Barriers Experienced by Small to Medium Enterprises in Downstream Coffee Production in Indonesia
Andar Hermawan, Yandra Arkeman, Titi Candra Sunarti 26
Innovation on Guardrail Press Tool with Simple Technology for Highway Road Business
Bambang Suhardi Waluyo and M.Sysmsul Ma'Arif 33
An Analysis of Innovation Network Performance on the Palm Oil Industry in North Sumatera
Danang Krisna Yudha, Aji Hermawan and Machfud 34
Application of Nanotechnology to Improve Physical Properties of Red Fruit Emulsion in order to Increase Its Industrial Use
Murti Ningrum and Syamsul Maarif 41
Exploring the Internationalization Process Model of an Indonesian Product – Case study: Fruit Chips SME’s
Dickie Sulistya Apriliyanto, Hartrisari Hardjomidjojo, Titi C Sunarti 47
Innovation Management in Indonesian Palm Oil Industry
Karim Abdullah, Aji Hermawan and Yandra Arkeman 53
Innovation Design Process for Gayo’s Coffee Quality Improvement
Rahmat Pramulya, M Syamsul Ma'Arif and Tajuddin Bantacut
59
Technology Innovation Adoption to Improve the Performance of Dairy Small-Medium Enterprises (SME): Case study in Pangalengan-Bandung Regency, West Java, Indonesia
Nuni Novitasari, Titi Candra Sunarti and Nastiti Siwi Indrasti
67
Process Innovation for Producing Bioethanol from Oil Palm Empty Fruit Bunches by Improving Fermentation Conditions
Fitriani Kasim, Novizar Nazir and Syamsul Ma'Arif
76
Managing Innovation through Knowledge Sharing in An Indonesia Coconut SME
Muchammad Kordiyat P, Machfud, Nastiti S Indrasti
82
Increasing Added Value of Banana by Producing Synbiotic Banana “Sale” Using Innovation & Technology Strategy Approach
Eka Ruriani
88
Innovation Palm Fronds Briquettes Through Noncarbonization Process
Petir Papilo, Syamsul Ma'Arif and Yandra Arkeman
93
Graphic Design Innovation As Brand Identity For “Mahlzeit N 'Das Brot “ Bread Packaging
Zulkarnain, Deny Dwi Lestari and M. Syamsul Ma'Arif
100
An AHP Application for Selecting A Business Innovation Strategy of Chocolate SMEs in East Java
Yani Kartika Pertiwi, M. Syamsul Maarif and Machfud
104
Understanding local food consumers and their motivations: A case study in Padang city
Poppy Arsil
110
Spatial Model Design for Competitive Improvement of Small Medium Scales Enterprises (Case Study: Bogor City)
Hartrisari Hardjomidjojo, Harry Imantho and Armaiki Yusmur
116
System Analysis and Design for Selecting Chitin and Chitosan Industry Location by Using Comparative Performance Index (CPI) Method
Denia Sismaraini, Nastiti S. Indrasti and Taufik Djatna
121
Arduino-Based Temperature Monitoring Device for Cold Chain Transportation
Delmar Zakaria Firdaus and Endang Warsiki
129
Development of Downstream Cocoa Industry: Exploring the Role of Government and Small and Medium Industry in Partnership
Farda Eka Kusumawardana, Yandra Arkeman, Titi C Sunarti
134
The Role of Communication in the Technology Transfer (A Case Study at the Center for Agro-based Industry)
Anindita Dibyono, Sukardi, Machfud
140
The Center for Pulp and Paper Appraising its Productivity in Generating Industry-Applicable Research: A Best Practice Illustration
Ahmad Rudh Firdausi, Anas M Fauzi, Machfud
147
Frontier Approaches in Process and Bioprocess Engineering
Identification of Flavor Compounds In Cemcem (Spondiazpinata (L.F) Kurz) Leaf Extra
156
Luh Putu Wrasiati, Ni Made Wartini and Ni Putu Eny Sulistyadewi  
Synthesis and Characterization of Nanosilica from Boiler Ash with Co-
Precipitation Method  
Wahyu Kamal Setiawan, Nastiti Siswi Indrasti and Suprihatin  
The Comparison Of Media on the Microalgae Nannochloropsis sp. Culture  
Anak Agung Made Dewi Anggreni, I Wayan Arnata and I B Wayan Gunam  
Identification of Media and Indicator Liquid as A Recorder Smart Label  
Endang Warsiki and Riris Octaviasari  
The Effect of Consentration of Mes Surfactant From Palm Oil and  
Consentrasion of Inorganic Salt to Interfacial Tension Value  
Rista Fitria, Ani Suryani, Mira Rivai and Ari Imam  
Effect of Nano Zinc Oxide On Bionanocomposite  
Siti Agustina, Nastiti Siswi Indrasti, Suprihatin and Nurul Taufiqu Rohman  
The Effects of Molar Ratio Between 80% Glycerol And Palm Oil Oleic  
Acid on the Synthesis Process of Ester Glycerol  
Mira Rivai, Eriiza Hambali, Giovanni Nurpratiwi Putri, Ani Suryani,  
Pudji Permadi, Bonar T.H Marbun and Ari Imam Sutanto  
Selecting Part of Natural Fiber EFB which has Best Mechanical Strength  
through Tensile Test Analysis for Composite Reinforced Material  
Farkhan, Yohanes Aris Purwanto, Erliza Hambali and Wawan Hermawan  
Effect Of Ethyl Methane Sulfonate (EMS) On Growth Rate, Cell Size, Fatty  
Acid Content And Antioxidant Activities Of Dunaliella sp.  
Mujizat Kawaroe and Amelia Gustini  
Identification of phenol red as Staphylococcus aureus indicator label  
Dunaliella sp.  
Melati Pratama, Endang Warsiki and Liesbetini Hartoto  
Enhancing Ethanol Tolerant of Escherichia coli Recombinant by Glutamate  
Addition under Aerobic Conditions  
Indra Kurniawan Saputra, Prayoga Suryadarma and Ari Permana Putra  
In Vitro Potentifal of Antibacterial Marine Microalgae Extract  
Chaetocerosgracilis Toward Staphilococcus epidermidis Bacteria  
Ardhi Novraldi Ginting, Liesbetini Haditjaroko and Iriani Setyaningsih  
The Potential Applications of Modified Nagara Bean Flour through  
Fermentation for Innovation of High Protein Analog Rice  
Susi, Lya Agustina and Chondro Wibowo  
Studies on the Characteristics of Pasayu (Pasta of Waste-Cassava)  
Fortification as a New Product Development  
Marleen Sunyoto, Roni Kastaman, Tati Nurmala and Dedi Muhtadi  
Optical And Particle Size Properties Of Sargassum Sp Chlorophyll As Dye-
Sensitized Solar Cell (DSSC)  
Makkulawu Andi Ridwan and Erliza Noor  
Alkaline Pre-Treatment of Gelidium latifolium and Caulerpa racemosa for  
Bioethanol Production
Dwi Setyaningsih, Neli Muna, Elisabeth Yan Vivi Aryanti and Anastasya Hidayat

Abstract—The scarcity of fuel is one of the serious problems in Indonesia because it can disturb people daily activities. One way to prevent the increasing fuel usage is by providing information about biodiesel as an alternative energy source. This information is served in the form of web base information for palm oil biodiesel agroindustry with Green House Gas (GHG) analytical module. This research is aimed at providing information about data production and area of oil palm plantation, data production of biodiesel and GHG analysis module to perceive GHG emission. This information system has some main features including graph of data production, area of oil palm plantation, biodiesel data production, page editor, and shown results of GHG analysis. Using this information system, it can be decided whether an area has a high GHG emission or not. This system, therefore, can be used as a region reference for emission reduction.

I. INTRODUCTION

The limiting availability of fossil fuel has brought people attention to the use of plant oils as alternative sources of fuel. Biodiesel is an alternative energy use to fulfill their energy needs for transportation, household, and industry. These need can be fulfilled easily if there is sufficient information available for public.

The need for quick, appropriate, and accurate information is an important aspect in human’s life. As information develops very quickly, a better information system is needed. Designing or developing a web is a way that can be done in order to provide public with access to information.

Indonesia is a country with 98.56 million hectares of forest area (Ministry of Forestry, 2012). One of the commodities potential to develop in this country is oil palm that can be utilized as an alternative energy in the form of biodiesel. However, limited centralized information on oil palm and biodiesel has hampered biodiesel development. There are only a few websites available today providing information on biodiesel and oil palm. Latest advancement in technology has driven the use of web-based information system in which all information available is presented by using Internet medium.

Information system of biodiesel and oil palm is made to provide the public with information on oil palm production, oil palm plantation area, and biodiesel production. The development of this information system is aimed at assessing the integrated and latest information about biodiesel, oil palm, and analysis of greenhouse gas effect as a tool to determine the gas emission value resulted from the land use changes.

The aims of this study is to design web-based information system on data of oil palm production and land area and biodiesel production in Indonesia by presenting them in forms of tables and graphs depicting results of greenhouse gas effects analysis in detail as a result of land use changes.

II. METHODS

A. Rationales

Fuel oil scarcity is one of the serious problems faced by many countries including Indonesia. This country, however, is a developing country in which most of its land is a forest area. This area provides oil palm, a commodity that can be used to produce biodiesel as an alternative energy source.

Oil palm production is significantly increasing over years. This has created a land use change which
brings a negative effect in the form of increased emission of greenhouse gasses. Providing information about oil palm biodiesel is a way that can be done to avoid fuel oil scarcity.

The advanced technology can be used to create a centralized and integrated information system. An information system designed in a web form is more accessible for public and provides information related to oil palm and biodiesel with an analysis module of greenhouse gasses in web. The concept framework of biodiesel industry management in order to optimize feedstock procurement is depicted schematically in Figure 1.

![Diagram of framework of thought](image)

Fig. 1. Framework of thought

B. System Development

Web-based information system of oil palm biodiesel agroindustry is developed by using a System Development Life Cycle (SDLC) methodology. Stages of the development include planning, system analysis, system design, system implementation, and system maintenance (O’brien, 1999).

The advantages and disadvantages of SDLC system development are listed in Table 1.

<table>

E. System Design

There are three main activities in this stage, namely interface design, data design, and process design. System design stage is a procedure of converting logical specification to a design that can be implemented in an organizational computer system.

According to Whitten et al. (2001), interface design is a prototype in which a work model is designed and modified repeatedly by using feedbacks from end users. The activity in interface design focuses on interaction support between end user and computer-based application. Data design is done in database structure design that will be used by system. Process design focuses on software design in the form of proposed programs and procedures.

F. System Implementation

System implementation is a stage that takes longer time and a complex process. Activities done in this stage include software and hardware acquisition, software development, database development and testing, data conversion, and various other programming activities.

G. System Maintenance

System maintenance is the last stage in SDLC. In this stage, monitoring, evaluation, and modification are done to make repairs which are important or compatible to end user needs. System maintenance is done by an administrator who is appointed to keep the system operate well as needed.
III. RESULTS AND DISCUSSION

A. Planning

This web-based information system with greenhouse gases analysis is selected as an effort to avoid fuel oil scarcity. The solution given is the provision of information about biodiesel as an alternative energy source and oil palm as a potential feedstock for biodiesel production.

Web technology is used as the basis of this information system development as the scope of this information system users is wider and centralized. Important things needed in this system development include data, time, cost, hardware, and software.

Data are one of the main things that need to be reviewed in information technology. Data utilization covers many aspects. Data describe a representation of facts composed structurally (Vercellis 2009). This information system is developed by using database as the main source of information which is presented to users. Data about oil palm are taken from the Statistic Bureau (BPS) and data about biodiesel production are taken from the Directorate of New Renewable Energy and Energy Conservation (EBTKE). In this stage, data are highly required as they are to be converted into information in the system.

The development of this information system takes time for data selection, data input, and data conversion to the form that fitted the system needs, data correction, and appearance design. Extra power and thought are also needed to get the optimum results.

The cost of this information system development consists of direct and indirect costs. According to Al-Fatta (2007), several things needed to be considered in designing an information system. These include performance analysis, information, economical value, efficiency, and service that can be given by the system. Higher measurement in economical aspect of a system is an indication that the system is worth developing.

The availability of hardware in this information system development is highly required to allow the required software operate optimally.

B. System Analysis

System analysis process in the development of an information system is a procedure done to assess any problems that may occur, develop alternative problem solutions, and develop specifications of new, proposed, or modified systems (Sutabri, 2004). System analysis is aimed at synchronizing user needs and the operational system being developed.

The information system being developed is dynamic meaning that it is able to interact with visitors of the site, it can show information originating from database, and pages on the web can change automatically (Sutisna, 2007).

World Wide Web (WWW) or commonly known as web is an information net using a Hyper Text Transfer Protocol (HTTP) that can be accessed through a simple interface. Bowo (2005) stated that a web is a component or a group of components consisting of texts, images, sounds, and animations making it as an interesting information medium.

System analysis is done through the stage of identification functional and non-functional needs. In this study, the problem found in system analysis is the finding that the availability of centralized information about oil palm and biodiesel is public functional need. This need just appears as there is a land utilization change into oil palm plantation area. This change in land function has resulted in the increased greenhouse gases emission so that the analysis of greenhouse gases emission measurement in the system is required. Meanwhile, interesting and consistent interface appearance that made it easy to use by users is found to be a non-functional need.

C. System Design

System design is a stage that describes how the system fulfills the users’ need of information. System design stage plays an important role in creating a good quality system. System design consists of interface design, database design, and process design.

1) Database Design: Database is a group of data stored systematically in a computer and can be changed, deleted, erased, and added by using software to produce information. Data are stored in the form of tables and the stored tables are interconnected. Database design is affected by the sharpness of the system analysis to be produced and the result of this design will give significant effect on the resulted system (Sidik, 2005).

This web-based information system is developed to present information on oil palm production, oil palm plantation areas, and biodiesel production data in graphs or tables. The database developed for this web-based information system consists of 100 tables. The tables which are stored based on the category of the information needed by the system consist of oil palm production tables, biodiesel production tables, oil palm plantation areas tables, and values of greenhouse gases analysis tables. Each table has different identities, for example, latpb, latpr, ppb, ppr, admin, etc. Not all tables have relation one to another.

2) Process Design: The process design of this information system is made by using a contextual diagram as shown in Figure 2.
It is shown in Figure 2 that there is an interconnection between user and administrator. In this system, user is one who obtained information from the system and administrator is one who controlled and renewed information including the database in the information system. Users involved in this system are public.

3) Interface Design: Interface design in an information system is divided into two displays: an interface for administrator and another for users. The function of interface is to show the location of information needed by users.

The displays of each interface, user and administrator, are made as interesting as possible for their easy operation. For user interface, for example, the display is made interesting so that it would be easy for users to get the information they needed (Figure 3). Meanwhile, for administrator interface, the display is made in such a way so that it would be easy for the administrator to enter, erase, or change data.

On the user home page there are the image and logo of the information system. The navigation menu consists of Home, Oil Palm, Biodiesel, GHG (greenhouse gases), and Contacts (Figure 3). On the first user page, there are paragraphs about oil palm in both Bahasa Indonesia and English. Oil palm menu provides information on oil palm and biodiesel menu provides information on biodiesel. GHG menu is available for users who would conduct the analysis of greenhouse gases emission value.

The oil palm page provides information of data on production of state-owned, people, and private plantations, plantation areas of major estates in provinces and regencies, and number of major plantations.
The displays on other pages such as those displaying production of major state-owned plantations, major private plantations, and people plantations, have similar layout and contents. There are only the data in each information category which are different. The option menu on planting areas of major plantations based on provinces is made to display data on plantation areas in provinces in Indonesia.

Biodiesel page provides information on biodiesel production and how it is made from oil palm. There are 4 options on biodiesel interface page. These contents include biodiesel making, overall and domestic biodiesel production, and biodiesel export.

Graphs and tables are also shown on biodiesel interface page to make it easier for users to get information. The graphs and tables are in the similar forms to those on oil palm interface page. Data on biodiesel production are obtained from Directorate General of New Renewable Energy and Energy Conservation. However these data are not ready for publication as there are part of the data that are not yet collected. This information system is made for EBTKE for update of data and content on the web. The availability of this web-based information system is expected to assist public and government in acquiring information.

The information on biodiesel and oil palm pages is obtained from the summary and references as the result of literature study. Palm oil production process consisting of transesterification, washing, drying, and filtration, is briefly described. Interesting information display such as biodiesel process graphs makes it easier for users to understand the content of a web page.

The next page is greenhouse gases (GHG) page on which analysis of GHG emission value as a result of land use changes can be found. There are six calculation stages on this page. Each stage has its value in accordance with the options given.

This GHG analysis is the analysis of the integration result of GEF (Global Environment Facilities) calculation which is originally made in excel and then implemented in web form. The interface page of GHG analysis is shown in Figure 6 and 7.

As shown in Figure 6, there are 2 stages of GHG emission value analysis. In stages 1 to 4, the determination of CO₂ emission value from land direct use is done. In each stage, the option boxes are to be filled in. Each option box is provides in accordance with the rules for GFE calculator.

In stage 5 and 6, as shown in Appendix 1, the calculation of the difference between soil organic carbon content and standardized soil organic carbon content after land use change is done. Stage 6 is the last stage in the analysis to result in GHG emission.
value from land use change.

The next page is interface display on the administrator page. Administrator is one appointed and trusted to monitor and update data in an information system. The updated data are used as input on user pages. Prior to login to the administrator home page, an administrator has to put in an identity and password (Figure 8).

![Fig. 8. Administrator login page](image1)

The administrator then selects data to be updated. Brief information about oil palm is also available (Figure 9). The category of information shown on the administrator page is synchronized with that on user page. Administrator can also select Oil Palm and Biodiesel menu to monitor or update data existing in each menu offered.

![Fig. 9. Administrator home page](image2)

The display of Oil Palm menu page on the administrator page is similar to that on the user page. However, the information category here is used to select data to be manipulated (changed, erased, and added).

There are the options of the plantation areas of major state-owned plantations and major private plantations. Each is presented in provincial and regent basis. The next option is the oil palm production of major state-owned plantations, major private plantations, and people plantations and each is presented in provincial and regent basis. The displays on this page are not far different from those on the oil palm user page. The only difference is that on user page there is a “See Graphs” button which is not available in the oil palm administrator page.

Data to be updated can be changed by selecting the category available on oil palm and biodiesel administrator page. Data display can then be seen in one of the information categories as shown in Figure 10. On the right side of the table there are options of data manipulation (change, erase, add).

The Add Data button on each oil palm and biodiesel administrator page is used to update data. The box form in Add Data tables is shown in Figure 11.

![Fig. 10. Oil palm administrator page](image3)

Tables in Administrator Biodiesel menu are similar to those in Administrator Oil Palm menu. Yet, biodiesel data are taken from the whole country. Edit and Erase options in ‘process biodiesel production’ columns are used to modify data. This function is also available in the administrator page.

Add Data form in Figure 11 has 4 boxes to be filled in with name of province for plantation area and oil palm production on the provincial basis and name of regency and oil palm production on the regent basis. There are also Plantation Area (ha), Production (ton), and Year boxes.
D. System Implementation

The implementation stage is a coding stage to materialize the existing design into an information system. The followings are done in this stage.

1. Software are procured to create a good web-based information system. The required software include Adobe Dreamweaver CS 6, Adobe Photoshop Portable, XAMPP 1.8.1, Microsoft Visio 2010, and Web Browser (Mozilla Firefox, Google Chrome, and Internet Explorer).

2. Coding is a programming activity to convert the whole design into a system device that fits users’ need. All programming activities and database development are done on Windows 8 operating system. This web-based information system is developed by using Adobe Dreamweaver CS6 on a PHP programming basis.

3. After the coding activity is finished, the system is installed to the internet web so that the accessibility of the system can be tested. The system accessibility in Web Browser (Mozilla Firefox, Google Chrome, and Internet Explorer) is tested.

E. System Maintenance

This is the final stage in a system development system (SDLC) consisting of system monitoring, evaluation, and modification. System maintenance is done during and after the designing process.

The developed system is still in prototype form. Therefore, for system maintenance stage, only monitoring activity is done when performance test and evaluation are conducted. Modification is then done to make the developed system fits user criteria.

IV. CONCLUSIONS AND RECOMMENDATIONS

A. Conclusions

This web-based information system is able to visualize tables and graphs that fit user need of an easy search for information on oil palm production, biodiesel production, and oil palm plantation area. The implementation of the analysis of greenhouse gases emission value with a land use change which has been previously integrated in the Microsoft Excel format by GEF is successfully done on a web basis.

B. Recommendations

Further studies on the development of an information system with different system approach, different information contents, and additional analysis modules of greenhouse gases emission calculation are recommended.
